NOOL IS

Release: R3.0

From a user's perspective, the **NOOL Information System** (NOOL IS) release R9.0 introduces the following **main changes**:

1. SECURITY

Authorisation token management has been improved. The token's validity is governed by a parameter in the settings.
The token's validity is currently set to 12 hours. All changes to the settings and to MFA are logged.

2. USER MANAGEMENT

User Management has a redesigned interface that simplifies account setup and access control. **The main changes are:**

a) **Overview dashboard** – displays active and blocked accounts, users without MFA configured, and alerts for accounts requiring review.

b) **User creation wizard** – guides the administrator through setting up the role, organisation, contact details, MFA and notifications, right through to verifying and sending the registration email.

c) **Clearer account details** – settings are organised into tabs for basic details, organisation and sites, MFA, notifications, login history and audit.

d) **Personal profile and notifications** – the 'My Profile' and 'My Notifications' options allow users to manage their own account and edit contact details, alerts and delivery addresses, subject to their permissions.

e) **Separate MFA and notification reports** – the administrator can monitor the settings of multiple users, filter and export reports, or apply new MFA settings in bulk.

f) **Access and change history available** – in the account details, you can view logins and important changes to your settings.
